

Interface Process

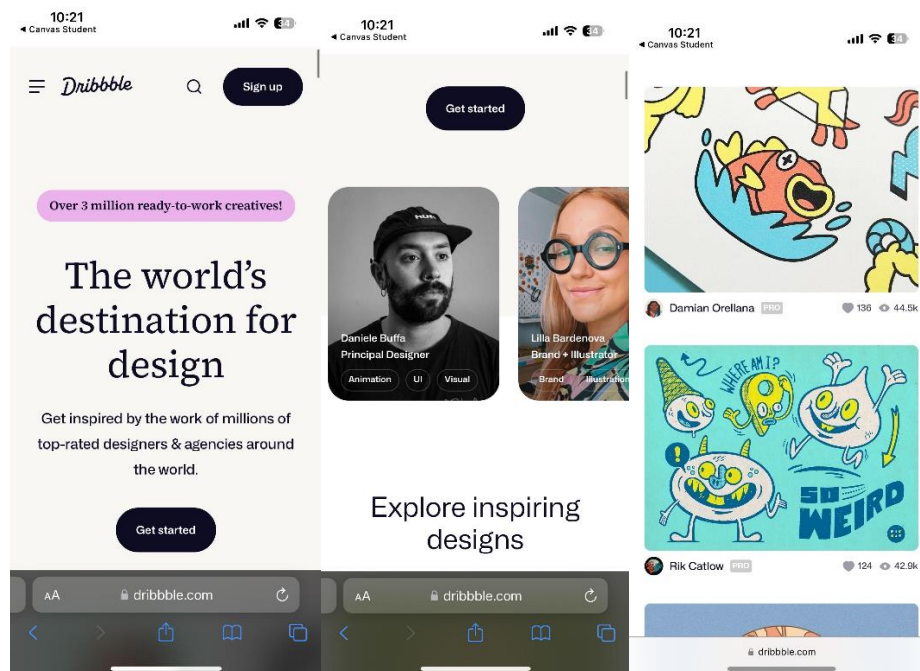

1. Read and respond to [10 Fundamental UI Design Principles that you Need to Know](#)[Links to an external site.](#) from the Dribbble website. Write about which fundamental you feel is most important and explain why.

I think the first principle is most important because keeping the UI design simple ensures that it is practical to the user first and foremost. Everything that is essential to the design is met.

2. Read and respond to the article, [10 Most Common Web Design Mistakes Small Businesses Make](#)[Links to an external site.](#), written by [Alan Smith](#)[Links to an external site.](#) for Usability Geek. Write about which mistake you feel is most horrible and explain why.

The third mistake of too confusing is most horrible to me because users should be able to understand what they are looking at.

3. Check out Justinmind's [30 responsive website examples](#)[Links to an external site.](#). Post screen shots of your favorite example and tell me why you chose it.

I enjoyed the Dribbble website because it is simple but still pleasing and fun to use. I loved the movement from the clips and the moving rectangles.

4. Read about [Style Tiles](#)[Links to an external site.](#). What do you think? Have you done anything like this before?

I have done style tiles before and they are very useful and effective for getting the basic idea and structure of your site.

5. Write a critique the local food truck [Krazy Trompos webpage](#)[Links to an external site.](#). Give suggestions that would make this site easier to use.

The site definitely needs organization and tabs. Everything is just on one page so creating different pages would help with navigating. The design is dated and there is no sense of hierarchy. It is not pleasing to look at.
